MRI EXAMINATION OF THE LUMBO-SACRAL SPINE

Technique of examination:

- Sagittal T1 & T2 WIs
- Axial T2 WIs
- No IV contrast was given.

Findings:

- Straightened lumbar curve.
- Normal sagittal diameter of the bony lumbar spinal canal.
- Decreased height and bright T2 signal intensity of the L4-5 and L5-S1 lumbar discs denoting their degeneration.
- L4-5 mild posterior and left postero-lateral disc bulge is seen effacing the epidural fat, indenting the theca and encroaches upon the lower aspect of the corresponding left exit neural foramen.
- L5-S1 mild diffuse posterior disc bulge is seen effacing the epidural fat, indenting the theca and encroaches upon the lower aspect of the corresponding exit neural foramina.
- No infiltrative marrow lesions.
- Normal MRI appearance of the conus medullaris and cauda equine nerve roots.
- No pre-vertebral or para-vertebral soft tissue signal abnormalities.

CONCLUSION:

- **L4-5 mild posterior and left postero-lateral disc bulge.**
- **L5-S1 mild diffuse posterior disc bulge.**
